ABSTRACT

The Car Rental Management System is a web-based application designed to simplify and automate the process of renting vehicles. The system allows users to browse available cars, view details, and make bookings in an efficient and user-friendly manner. It eliminates the need for manual record-keeping and reduces errors associated with traditional rental systems.

This project is developed using HTML, CSS, and JavaScript for the frontend, and MySQL for data management, providing an interactive and responsive user interface. The system includes features such as car selection, booking management, and rental history tracking. Each car is uniquely identified, and users can select vehicles based on their preferences.

The main objective of this system is to improve the overall efficiency of car rental services by providing a digital platform that is easy to use and accessible. It enhances user experience while ensuring proper data management and organization.

INTRODUCTION

With the increasing use of digital platforms, online systems have become essential in simplifying everyday tasks. The car rental industry also requires efficient systems to manage vehicle bookings and customer records. Manual methods are time-consuming and difficult to maintain, especially when the number of users and vehicles increases.

The Car Rental Management System is developed to provide a simple and effective solution for managing car rental services. It allows users to easily access information about available cars and perform bookings without any complexity.

This project focuses on creating a user-friendly interface and implementing basic functionalities such as car selection, booking, and record management. It helps in reducing manual effort and improves the overall efficiency of the system.

OBJECTIVES

- To design a relational database for a car rental management system
- To store customer details and booking information efficiently
- To manage car listings with images, prices, and availability
- To handle booking process based on user input
- To maintain booking history for users
- To ensure smooth retrieval and management of rental data

SYSTEM OVERVIEW:

The system works as follows:

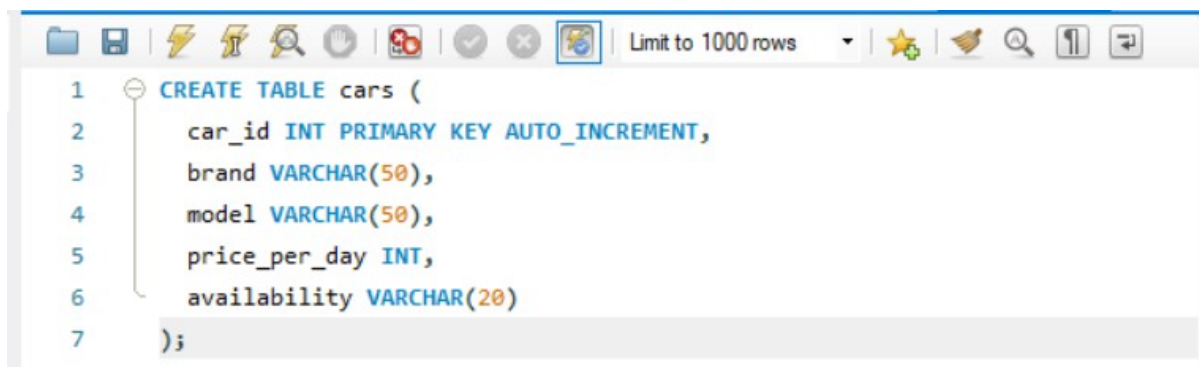

- The system starts with a homepage/dashboard
- Users can explore available cars with images and rental prices
- Each car listing displays basic details such as model, brand, and price per day
- Users can select a car and proceed to booking
- In the booking section, users enter details like name, contact number, email, and rental duration (from date to date)
- After submission, booking data is stored in the database
- The system also updates booking history so users can view their past/current bookings
- Admin can manage car listings and booking records from the backend.

SYSTEM IMPLEMENTATION:

DATABASE DESIGN-

Cars Table-

- car_id (Primary Key)
- brand
- model
- price_per_day
- availability

```
1 CREATE TABLE cars (  
2     car_id INT PRIMARY KEY AUTO_INCREMENT,  
3     brand VARCHAR(50),  
4     model VARCHAR(50),  
5     price_per_day INT,  
6     availability VARCHAR(20)  
7 );
```

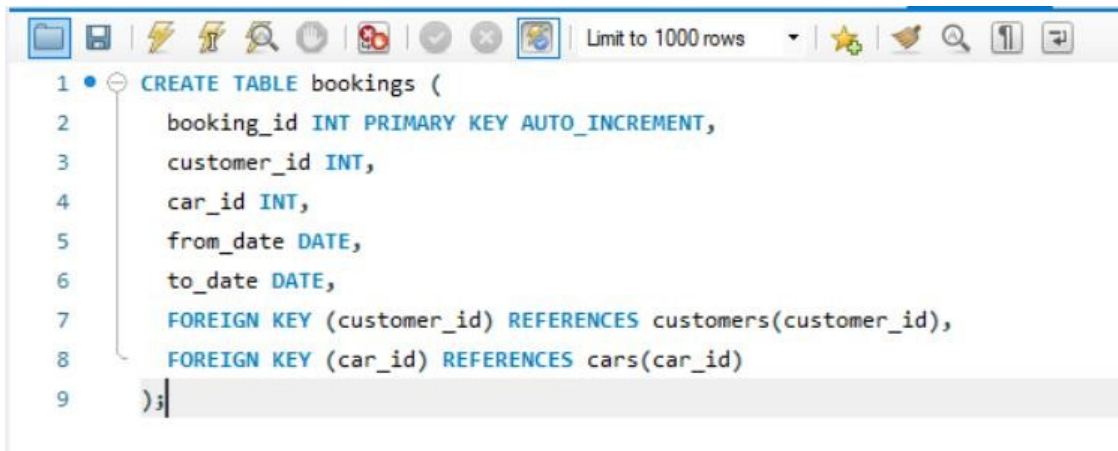

Explanation:

- car_id uniquely identifies each car (Primary Key)
- Stores car brand, model and rental price
- Availability shows whether car is free or booked

Bookings Table-

- booking_id (Primary Key)
- customer_id (Foreign Key)

- car_id (Foreign Key)
- from_date
- to_date

```

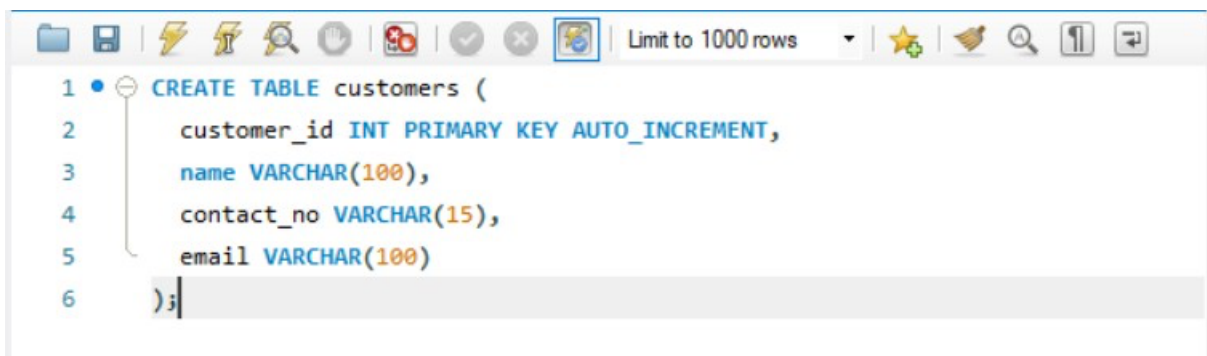

1 • CREATE TABLE bookings (
2     booking_id INT PRIMARY KEY AUTO_INCREMENT,
3     customer_id INT,
4     car_id INT,
5     from_date DATE,
6     to_date DATE,
7     FOREIGN KEY (customer_id) REFERENCES customers(customer_id),
8     FOREIGN KEY (car_id) REFERENCES cars(car_id)
9 );
  
```

Explanation:

- booking_id uniquely identifies each booking (Primary Key)
- customer_id links to Customers table (Foreign Key)
- car_id links to Cars table (Foreign Key)
- Stores rental duration (from-to date)

Customers Table-

- customer_id (Primary Key)
- name
- contact_no
- Email

```

1 • CREATE TABLE customers (
2     customer_id INT PRIMARY KEY AUTO_INCREMENT,
3     name VARCHAR(100),
4     contact_no VARCHAR(15),
5     email VARCHAR(100)
6 );
  
```

Explanation:

- customer_id uniquely identifies each customer (Primary Key)
- Stores personal details like name, phone, email

NORMALIZATION-

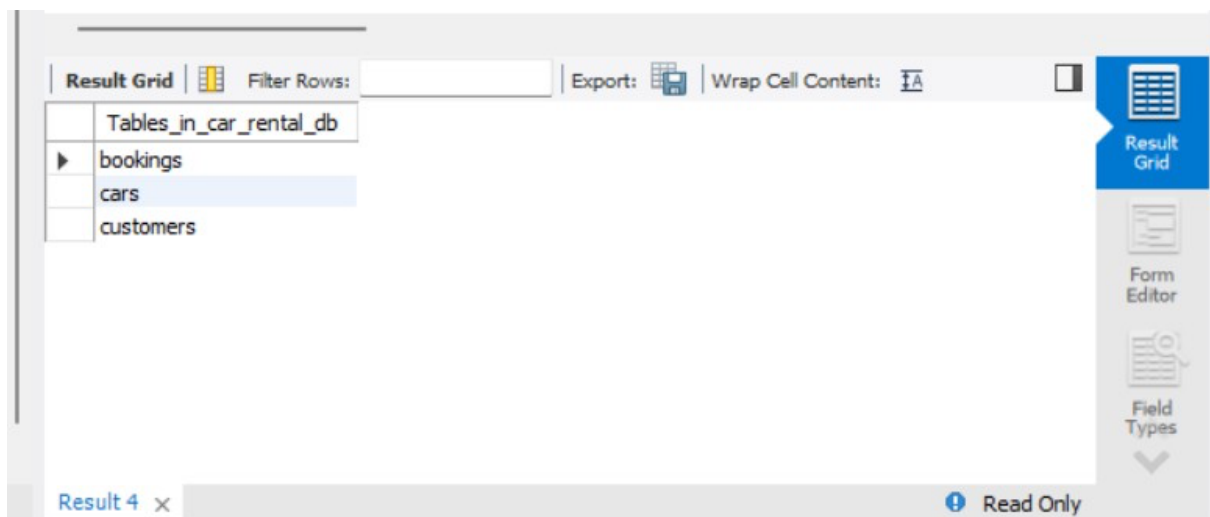

The database is normalized up to Third Normal Form (3NF):

- **1NF:** All attributes contain atomic values and there are no repeating groups.
- **2NF:** All non-key attributes are fully dependent on the primary key.
- **3NF:** There is no transitive dependency between non-key attributes.

This normalization reduces data redundancy, improves data consistency, and ensures efficient database management.

QUERY EXECUTION-

→ **Tables in Database:**

→ **Cars Table Data:**

Result Grid				
Filter Rows:				
	car_id	model	price_per_day	availability
▶	101	Toyota Innova	2500	1
	102	Hyundai Creta	2200	1
	103	Maruti Swift	1200	1
	104	Honda City	2000	1
	105	Kia Seltos	2400	1
	106	Tata Nexon	2100	1
	107	Mahindra Thar	3000	1
	108	Hyundai i20	1300	1
	109	Skoda Slavia	2300	1
	110	MG Hector	2800	1

cars 1 x Apply Revert

→ Bookings Table Data:

Result Grid						
Filter Rows:						
	booking_id	customer_id	car_id	start_date	end_date	status
▶	13	13	101	2026-04-14	2026-04-15	Booked
	14	14	111	2026-04-21	2026-04-23	Booked
*	NULL	NULL	NULL	NULL	NULL	NULL

bookings2 x Apply Revert

→ Customers Table Data

Result Grid				
Filter Rows:				
	customer_id	name	phone	email
▶	13	aakash tomar	9760589765	akash@gmail.com
	14	Anjali	9548827806	anjali@gmail.com
*	NULL	NULL	NULL	NULL

customers 3 x Apply Revert

→ Booking Details using JOIN Operation:

booking_id	name	model	price_per_day	start_date	end_date
13	aakash tomar	Toyota Innova	2500	2026-04-14	2026-04-15
14	Anjali	Toyota Fortuner	4000	2026-04-21	2026-04-23

→ Available Cars:

car_id	model	price_per_day	availability
103	Maruti Swift	1200	1
104	Honda City	2000	1
105	Kia Seltos	2400	1
106	Tata Nexon	2100	1
